

First Functional-Knock-Out in Rat Species

Nokad announced today that Amine ABINA, President and Chief Executive Officer will present new results of functional-Knock-Out in the Rat species at Charles River laboratories Seminar in Evry on April 4th at 9:15 am.

Dr ABINA will present the first functional-Knock-Out Nokad obtained in this species, after multiple successful models generated in mice, using its new proprietary immune based technology. The results obtained in this model, allowed the discovery of a new Erythropoietin-receptor pathway.

NOKAD is the first company to provide a full functional Knock-Out strategy in all mammals based on an immunological strategy.

This proprietary technology, today used by different pharmaceutical companies, had advantages to accelerate in vivo target validation and functional discoveries in the most relevant animal model or species. Testing synergies, interactions using the NOKAD strategy by doing in the same experiment, a Knock-Out on another Knock-Out, multiple Knock-Outs, a Knock-Out on a transgenic animal, a Knock-Out on a disease model (ob/ob, db/db, cancer models,...), Knock-Outs in different species, are now possibilities that are already performed simultaneously in the Nokad programs.
